

INTRODUCTION TO MPI AND HIGH PERFORMANCE COMPUTING

Prashant Piprotar

IIT Kanpur

15th May, 2020

Story Time ...

- Dr. Ritesh Patel got us a simulation task from one of his student at IIT.
- **Problem:** Task was taking weeks to complete.
- **Simple Solution:** Multithreading. Right?

`for(i = 0;i<4;i++){` -> Break down this loop to make it 4 parts.

```
    for( ... ){  
        for( ... ){ }  
    }
```

```
}
```

Calculations:

- Original task Duration: 8 Days (assumed)
- Fastest PC (at that time): Quad Core 4th gen i7.
- New Duration: About 2 Days

Multithreading to Clustering

- **Final Solution:** Multi threading + Multiple hosts
- **No of Hosts:** 4

Some Calculations:

```
for(i = 0;i<4;i++){           -> Break down this loop into 4 parts.  
    for(j=0;j<4;j++ ){       -> Break down this loop into 4 parts.  
        for( ... ){ // Tasks }  
    }  
}
```

4 PC * 4 Cores = 16 Cores

- **Completion Time:** Just few hours.

High Performance Computing

What is High Performance Computing?

- For 1st year Undergrad:
 1. Computing on High Performance Computers.
 2. Solving problems at very large scales.
 3. Simulations / Analysis that takes days to complete.
- Who uses HPC?
 1. Weather and climate research
 2. Bioscience and energy sector
 3. Automotive, aerospace, oil and gas exploration
 4. Financial simulation, etc.
- Similar Concepts :
 1. Supercomputing
 2. Parallel Computing

Why do we need them?

- Its Simple
- **To do things Faster.**

What does HPC include?

- Two main Hardware elements:
 1. Compute Elements (for Computation) : CPU, GPU, etc
 2. Network Elements (for Communication) : Infiniband, Ethernet, etc
- Two main Software elements:
 - Programming Models : MPI, Shared memory
 - (IMP) Your Application

What makes it HPC?

All the above things but at Larger Scale.

HPC Computer Architectures

Vector Computers (VC) - proprietary system

- – Provided the breakthrough needed for the emergence of computational science, but they were only a partial answer

Massively Parallel Processors (MPP) - proprietary systems

- – High cost and a low performance/price ratio.

Symmetric Multiprocessors (SMP)

- – Suffers from scalability

Distributed Systems

- – Difficult to use and hard to extract parallel performance

[Widely Used] Clusters – commodity and highly popular

- – High Performance Computing - Commodity Supercomputing
- – High Availability Computing - Mission Critical Applications

Horizontal vs Vertical Scaling

www.abhijitkakade.com

Vertical Scaling

(Increase size of instance (RAM , CPU etc.))

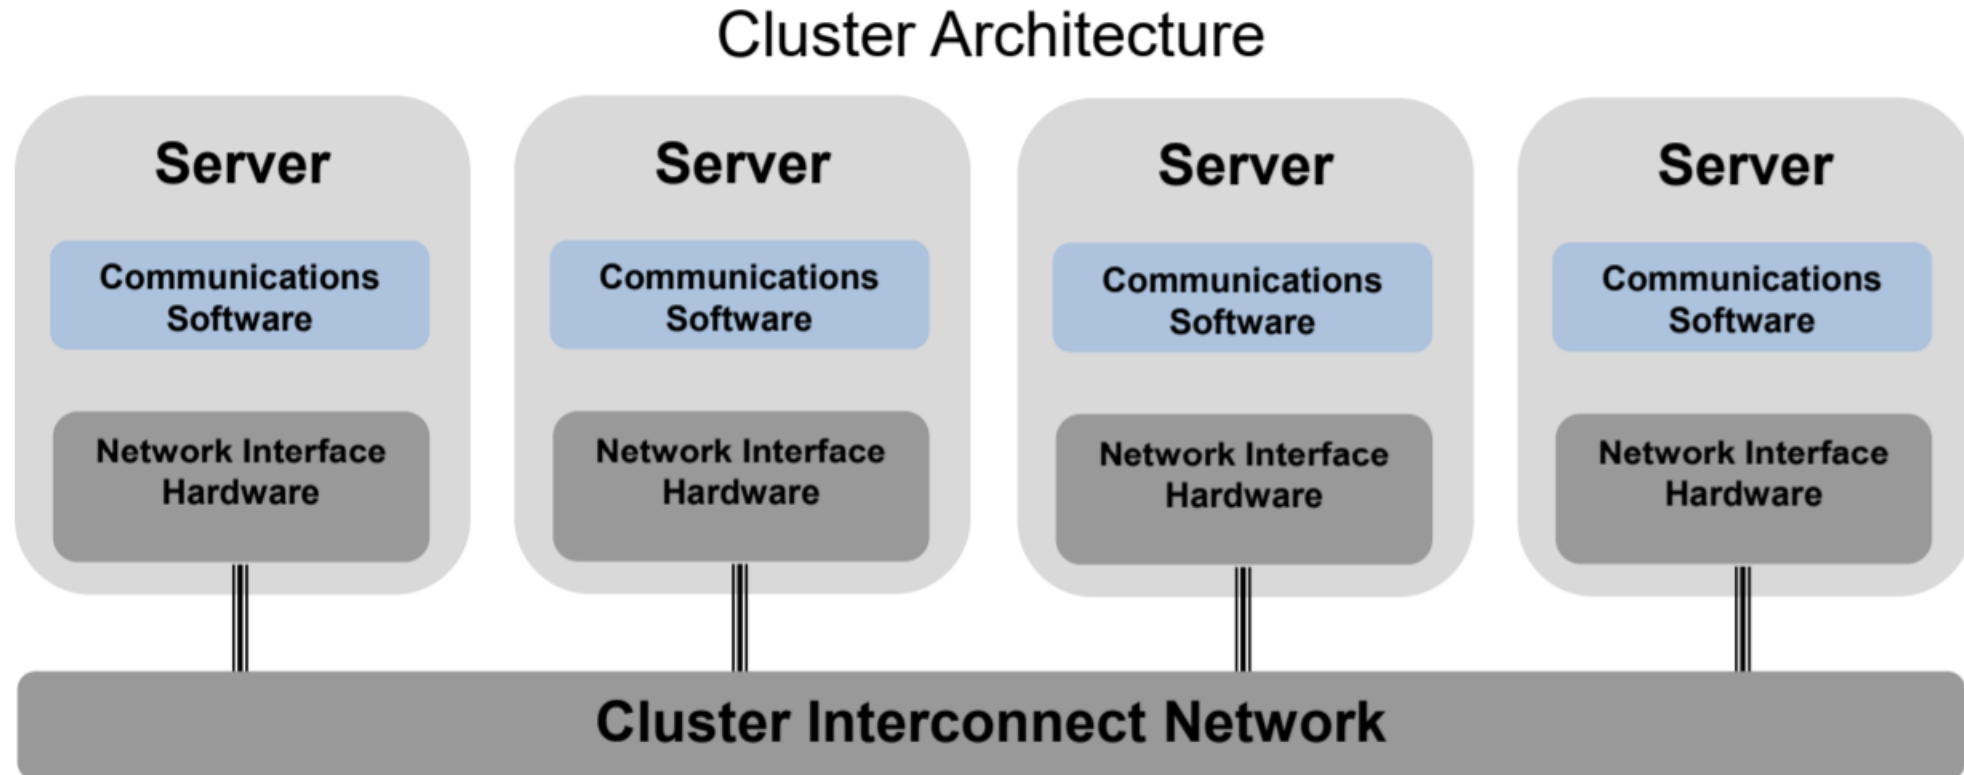

Horizontal Scaling

(Add more instances)

HPC Clusters – Affordable, Efficient and Scalable HPC Solution

COMPUTER FOOD CHAIN

Parallel Computing on a Large Number of Servers is More Efficient than using Specialized Systems

HPC Queue System

INTRODUCTION TO MPI

MPI- Message Passing Interface

- A standard for Message passing library.
- Efficient, Portable, Scalable, Vendor Independent.
- Supports: Distributed, Shared, Hybrid Memory architectures.
- Some Implementations:
 1. MPICH
 2. OpenMP
 3. Intel MPI
 4. Microsoft MPI, etc.

Demo 0: Hello World

Demo 1: Send Receive

Demo 2: Broadcast

Demo 3: A brief about my CloudMPI

Approach

As Inspired by : Network Performance Aware MPI Collective Communication Operations in the Cloud (Yifan Gong)

- Using existing MPI collectives
- Over hierarchical tree (sub communicators)

Conclusion

- Cluster is right now “the best” architecture for building HPC.
- Queue systems helps to increase the utilization.
- MPI reduces the efforts to operate HPC.
- You can make group projects and running on cluster made by lab PCs.

Q & A

Thank You

If you have any queries, mail it to prashplus@gmail.com
